Subject: 2012 Hemlock Woolly Adelgid Detection Survey Results

To: Erin Connelly, Forest Supervisor
Allegheny National Forest

For 2012, the Allegheny National Forest (ANF) utilized Jake Moore's hemlock classification and risk maps

(O:\NFS\Allegheny\Program\3400ForestHealthProtection\3410DetectionMonitoringEvaluation\hemlock woolly adelgid) to identify potential survey stands. Using ArcMap 9.3.1, stands assigned a risk level of 3 or 4 were intersected with stands containing 20/ft² or more of hemlock basal area. Within the resulting set of stands, surveys started in the southeast corner of the Forest and moved (generally) northwest assigning priority to stands with large influxes of recreation users.

Thirty six stands were surveyed in 2012 (Table 1; Figure 1) by ANF and Morgantown Field Office personnel, no signs of the hemlock woolly adelgid were detected. However, the presence of hemlock woolly adelgid especially in its early stage of infestation is extremely difficult to detect. The accompanying table and map show the locations of this year's survey.

Sincerely,

Robert Lueckel
Field Representative
Morgantown Field Office
